

Create Your First Insights – Assignment

Basic

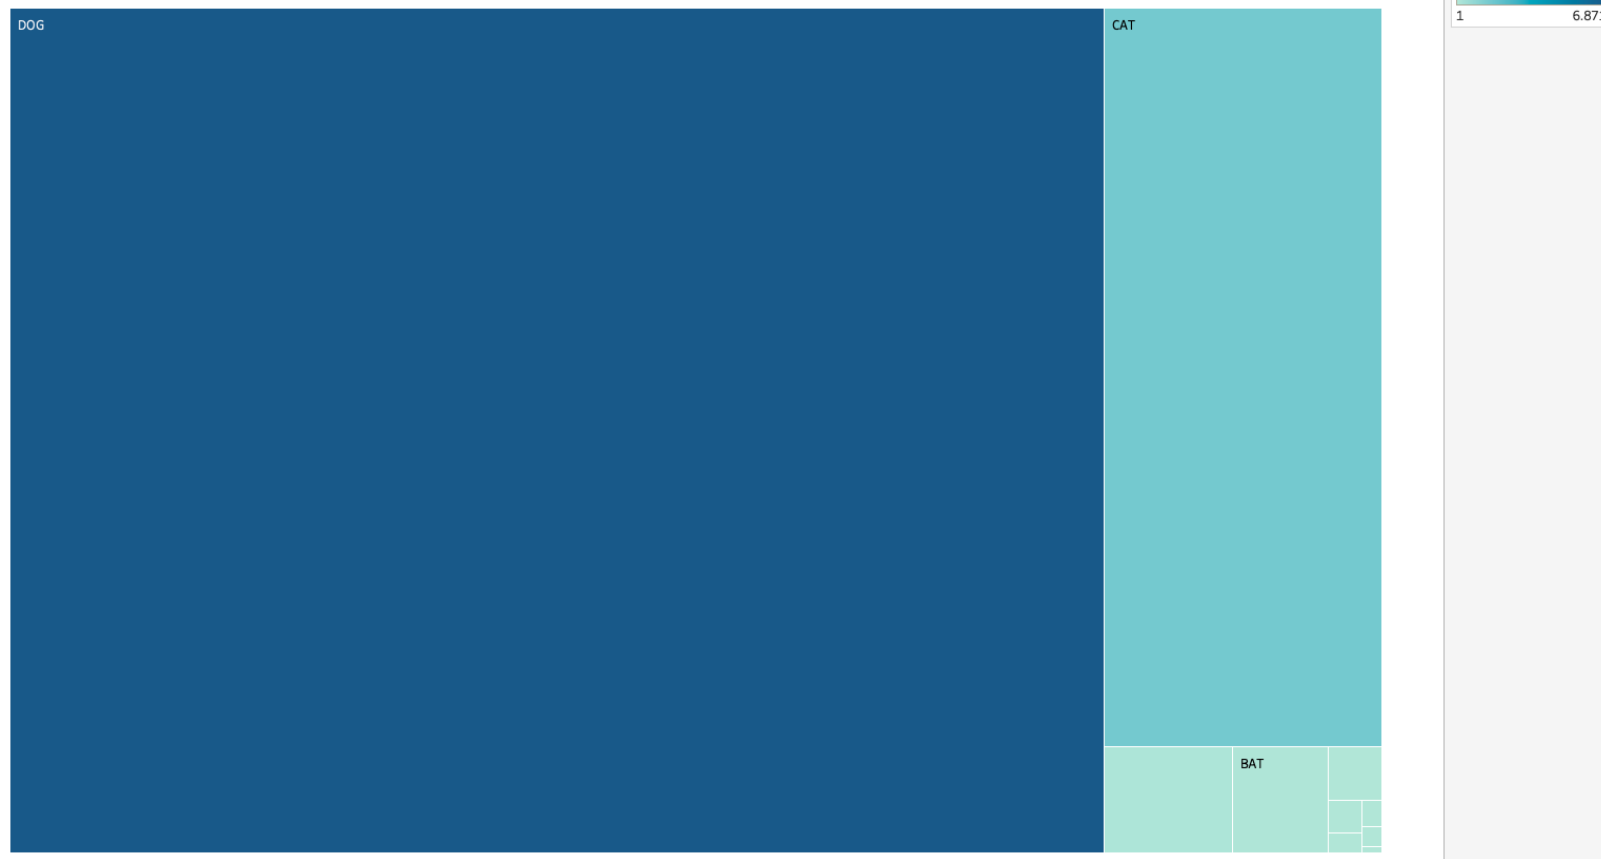

A lot of animals end up in a shelter because parents are afraid they would bite their children. Is this a valid concern? Let's take a look at the following questions by using the 'Animal Bites' dataset. In our dataset, every single **row or record** equals 1 animal bite. We should be able to create the following **3** visualizations.

Try to show the following:

- How many **bites** were there per **species**. I'm interested to see this as a **treemap**.
- A second visualization should work with the field called '**Where bitten?**'. This shows us the location on the person's body where he/she was bitten. I'm interested to see this together with the **number of animal bites** in a **pie chart**
- The final visualization, shows the amount of animal bites on a month level in a **line chart**. Every single **gender** should have its own line

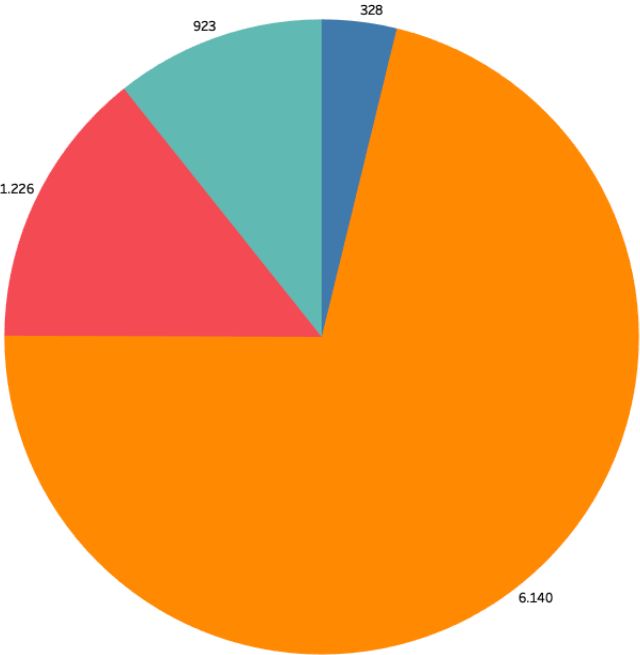

1. Species with the amount of bites

2. Where do we get bitten?

Where Bitten?

Null
