

Setting up your data source(s) – Assignment

Basic

I opened my own restaurant and would like to find out if it's possible to deliver food to my customers. I of course would like to start investigating if this would work out for my best customers. I keep a list of **Transactions, Customer Info, and Menu items** and would like to have it in the following way:

- Combine the information we can find in the **Transactions** excel file with the information in the **Menu and Customers** excel file. In total we should do 2 joins
- The column 'Earnings' can no longer show decimal numbers
- The 'Address' field looks funny, we rather have the City and the Street in 2 separate columns
- Rename and hide fields appropriately
- Assign the correct 'Geographic Role' to the newly created columns
- I don't want to deliver food outside of Belgium. Make sure we only see data for the country 'Belgium'
